Multiple plots of the pH spot check data vs. time, for the period 1995 – present as measured in the incoming water to the Monterey Bay Aquarium drawn from a ~50ft depth. Each of the following pages contains a 10-year period of the data, with the monthly mean ± standard error of the spot checks being presented. The pH was analyzed using the method outlined with this project. Both short-term seasonal changes and longer-term events, such as El Nino, are present in the data.

For questions or to gain access to the data archive please contact either Roger Phillips (<a href="mailto:rphillips@mbayaq.org">rphillips@mbayaq.org</a>) or Eric Kingsley (<a href="mailto:ekingsley@mbayaq.org">ekingsley@mbayaq.org</a>) at the Monterey Bay Aquarium.
